Notes: Lesson 3

- Functions in python determine the actions that a program can be capable of.
- to give a function a name we give it a name followed by two parentheses ()
- functions such as input() will be the most common in python
- an example for an input function can be; variablename = ("[prompt for user input]")

Num1 = input("Please enter an integer: ")
Num2 = input("Please enter another integer: ")

print(num1, " Multiplied by " ,num2, " is " , num1*num2, ")
